

Impregnation System

STAINLESS OR MILD

VARIOUS PUMP SIZES

ACCURATE MEASURING

MESH DCS COMPATIBLE

The Ranco Impregnation System consists of a positive displacement gear type pump, coupled to a variable speed DC motor. The output line feeds a stainless steel drip bar. The drip bar is placed across the top of the blend auger or overhead impregnation auger. As the blended product passes under the drip bar, the liquids are accurately metered and evenly distributed throughout the entire blend. Because of the systems unique design, product viscosity changes do not affect the rate of output.

- Various pump sizes
- Can be added to any Ranco blending system
- Accurately meters liquids onto dry blended fertilizer
- Stainless pumps available
- MeshDCS compatible
